

Source File: ~/1337/55/lab55.(C|CPP|cpp|c++|cc|cxx|cp)
Input: Under control of `main` function
Output: Under control of `main` function
Value: 2

Write a boolean function that determines if a string is an imperfect palindrome. An imperfect palindrome is a word, verse, or sentence that is the same when read backward or forward after the removal of all whitespace and punctuation and all alphabetic characters have been folded to the same case.

A header file is shown in Figure 1, a sample `main` function for testing your implementation is shown in Figure 2, and a sample execution sequence is shown in Figure 3. To use the `Makefile` as distributed in class, add a target of `lab55` to `targets2srcfileswithlibrary`.

```
1 #ifndef LAB55_H
2 #define LAB55_H
3
4 #include <string>
5
6 using namespace std;
7
8 // Function isPalindrome - returns true if string s is an imperfect
9 // palindrome and false otherwise
10 bool isPalindrome(string s);
11
12 // Function from Lab 47
13
14 // Function uppercase - returns string s with all lowercase letters
15 // converted to uppercase and all other characters unchanged
16 string uppercase(string s);
17
18 // Function from Lab 49
19
20 // Function stringReverse - returns the reverse of string s
21 string stringReverse(string s);
22
23 // Function from Lab 51
24
25 // Function removePunctuation - returns string s with all punctuation
26 // characters removed
27 string removePunctuation(string s);
28
29 // Function from Lab 52
30
31 // Function removeWhitespace - returns string s with all whitespace
32 // characters removed
33 string removeWhitespace(string s);
34
35 #endif
```
