Input: Standard Input
Output: Standard Output
Value: 1

Write a program that reads from standard input character-by-character and determines the number of whitespace characters, punctuation characters, and the distribution of character digits and alphabetic characters (case-insensitive). The input is of unknown length; however, input can terminate when the end-of-data marker is encountered. The output should be formatted as shown below. Only non-zero counts should be written.

A sample execution sequence is shown in Figure 1. To use the `Makefile` as distributed in class, add a target of `lab42` to `targets1srcfile`.
