Write a function whose prototype is given by

```
string replaceDigits(string s);
```

The function replaces each digit character of `s` with `#`; all other characters are left unchanged. The transformed string is returned to the calling function.

A sample `main` function for testing your function is shown in Figure 1. Commands to compile, link, and run this assignment are shown in Figure 2. To use the Makefile as distributed in class, add a target of `lab48` to `targets2srcfiles`.

```
1 #include <iostream>
2 #include <cstdlib>
3 #include <string>
4
5 using namespace std;
6
7 // Function replaceDigits replaces each digit character of s with '#';
8 // all other characters are left unchanged. The transformed string is
9 // returned to the calling function.
10 string replaceDigits(string s);
11
12 int main()
13 {
14     string str;
15
16     while (getline(cin, str))
17     {
18         cout << "Before: " << str << endl;
19         str = replaceDigits(str);
20         cout << " After: " << str << endl;
21     }
22
23     return EXIT_SUCCESS;
24 }
```
